SABZA Project Integrity Audit Report

Executive Summary

This audit report was prepared by SABZA's Verification Team to evaluate the integrity and consistency of a CDM-registered carbon project. Our AI-based anomaly detection and heuristic models flagged several inconsistencies that merit a desk review. The project's overall risk score is **0.616**, categorized as **Medium Risk**.

Registry	CDM
Anomaly Flag	Yes
Isolation Forest Score	0.7670
Triage Decision	Desk Review
Overall Risk Score	0.616
Risk Level	Medium

Detected Questionable Claims

Twelve (12) questionable claims were identified across project design and monitoring documents, including exaggeration of area coverage, timeline inconsistencies, and overestimated carbon benefits. Highlighted claims include:

• Area exaggeration – baseline forest cover understated.
• Overstated CO■ sequestration potential.
• Timeline inconsistencies in reforestation phases.
• Overestimated community and water retention benefits.
• Unrealistic economic outcomes.

NDVI and Reforestation Analysis

Mean NDVI Change: -0.1440
Observed start area: 787.14 ha
Observed end area: 149.93 ha
Predicted increase: -116.75 ha
Flag: No significant reforestation trend detected.

Ownership and Suspicious Network Observations

Ownership network shows 8 entities with multiple circular ownership links. Entities such as **BrightFuture Trust** and **Global Renewal Fund** exhibit high betweenness centrality, indicating potential shell coordination or centralized control. Recommendation: Verify beneficial ownership records for transparency.

Conclusion

The findings suggest inconsistencies in reported project performance and potential data exaggeration. Given the observed anomalies, a **Desk Review** is recommended to validate the integrity of reported carbon benefits.
